

What I need to know before my IUD placement

1. Why does the IUD procedure sometimes feel painful?

Traditionally, doctors use an instrument called tenaculum to hold the cervix steady. Most describe the sensation from this tool as a sharp pinch, which can also cause pain and bleeding.

2. What is carevix®?

Carevix® is an alternative to the tenaculum that uses gentle suction instead of clamping my cervix.

3. Can carevix® make my IUD insertion less painful?

Yes. Clinical studies show that patients experienced **up to 73% less pain¹** and **83% less bleeding** with carevix® compared to the tenaculum.

4. Is carevix® safe for me?

Yes. Carevix® is FDA-cleared and was carefully tested in clinical studies.

5. Can I ask my doctor to use carevix®?

Carevix® may not be right for every patient. Ask your healthcare provider if carevix® could be a part of your IUD insertion.
